# r-process in neutron-star mergers

Temperature =  $5.70E+09$  K  
 Density =  $3.01E+07$  g / cm<sup>3</sup>  
 Heating rate =  $1.13E+19$  erg / s / g  
 Entropy =  $9.99E+00$  kB / baryon  
 Ye = 0.130

github.com/jlippuner/SkyNet

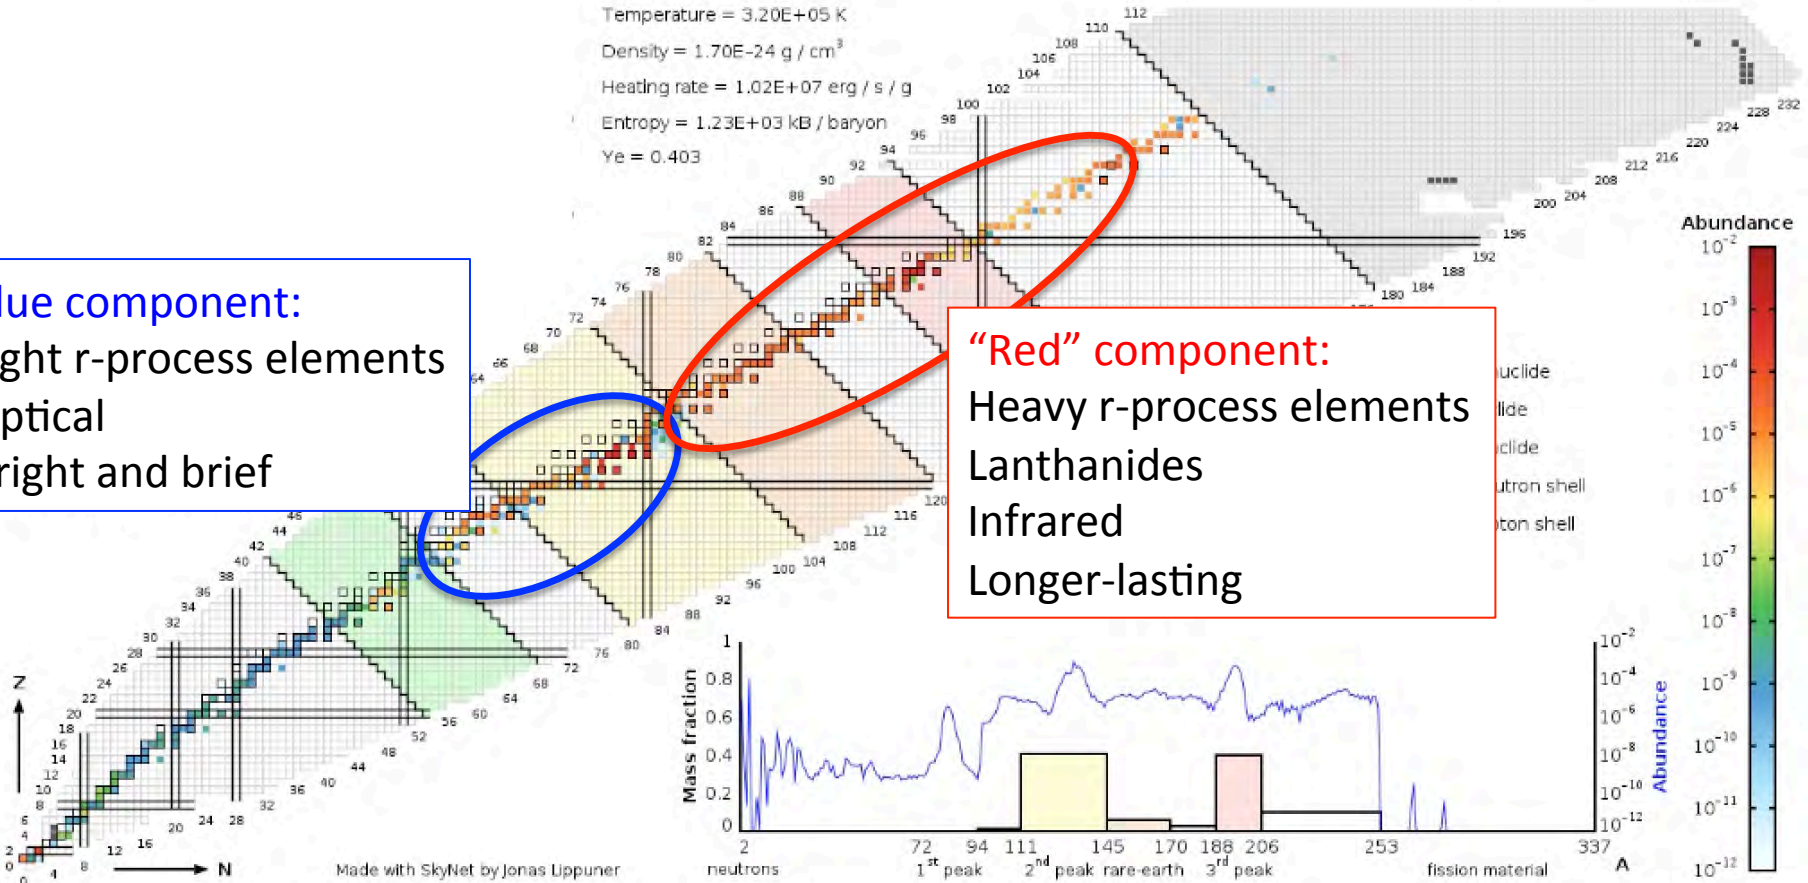

# r-process in neutron-star mergers

Temperature =  $3.20\text{E}+05$  K  
 Density =  $1.70\text{E}-24$  g / cm<sup>3</sup>  
 Heating rate =  $1.02\text{E}+07$  erg / s / g  
 Entropy =  $1.23\text{E}+03$  kB / baryon  
 Ye = 0.403

**Blue component:**  
 Light r-process elements  
 Optical  
 Bright and brief

**"Red" component:**  
 Heavy r-process elements  
 Lanthanides  
 Infrared  
 Longer-lasting

- GW170817 observations distinguish between heavy (red) and light (blue) components, but cannot get individual element contributions.
- Nuclear physics data needed to figure out the different contributions

# r-process in neutron-star mergers

- What is needed?

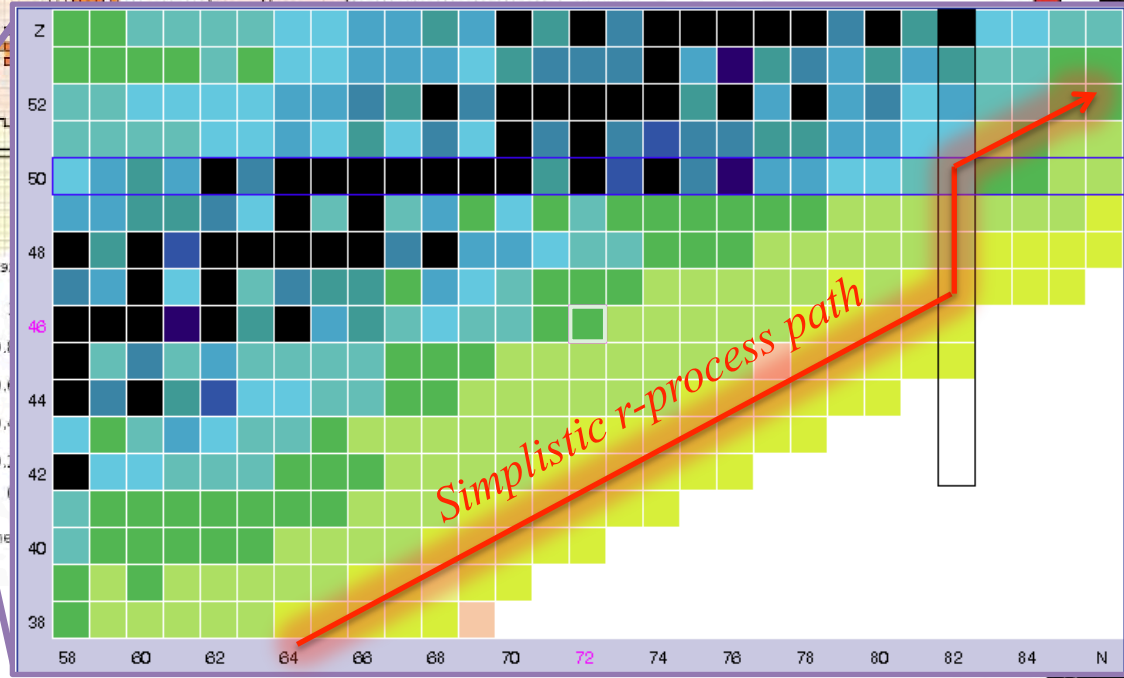

Temperature =  $3.20E+05$  K  
 Density =  $1.70E-24$  g /  $cm^3$   
 Heating rate =  $1.02E+07$  erg / s / g  
 Entropy =  $1.23E+03$  kB / baryon  
 Ye = 0.403

*Simplistic r-process path*

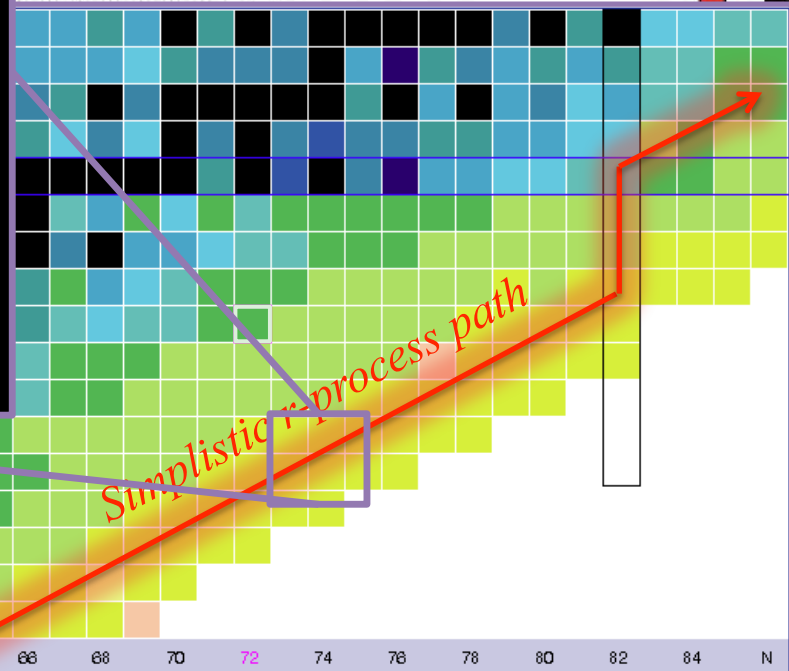

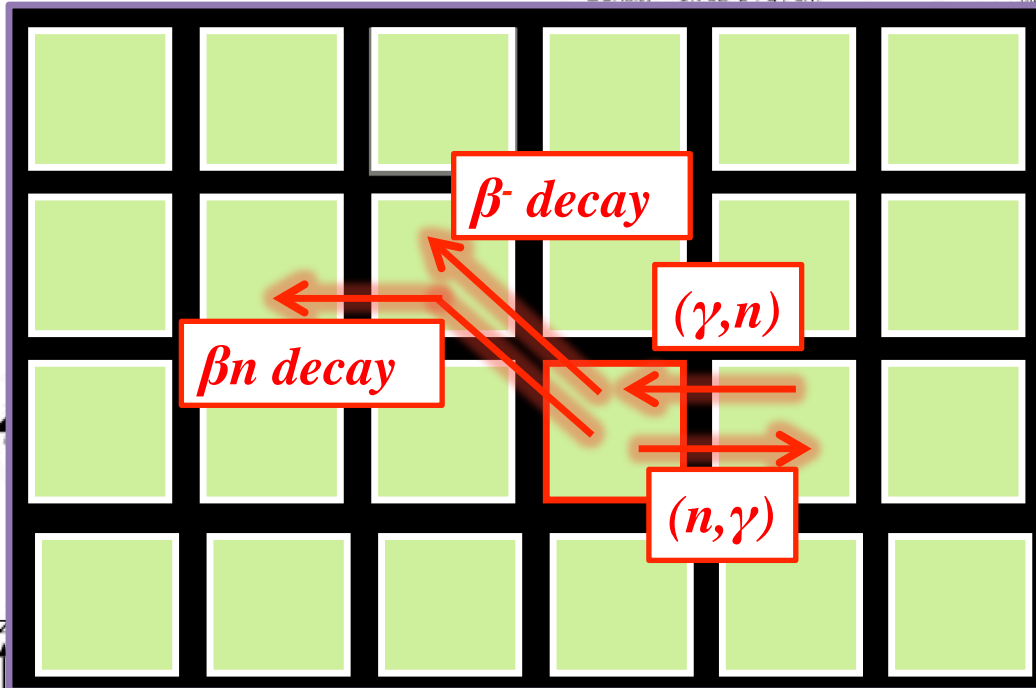

# r-process in neutron-star mergers

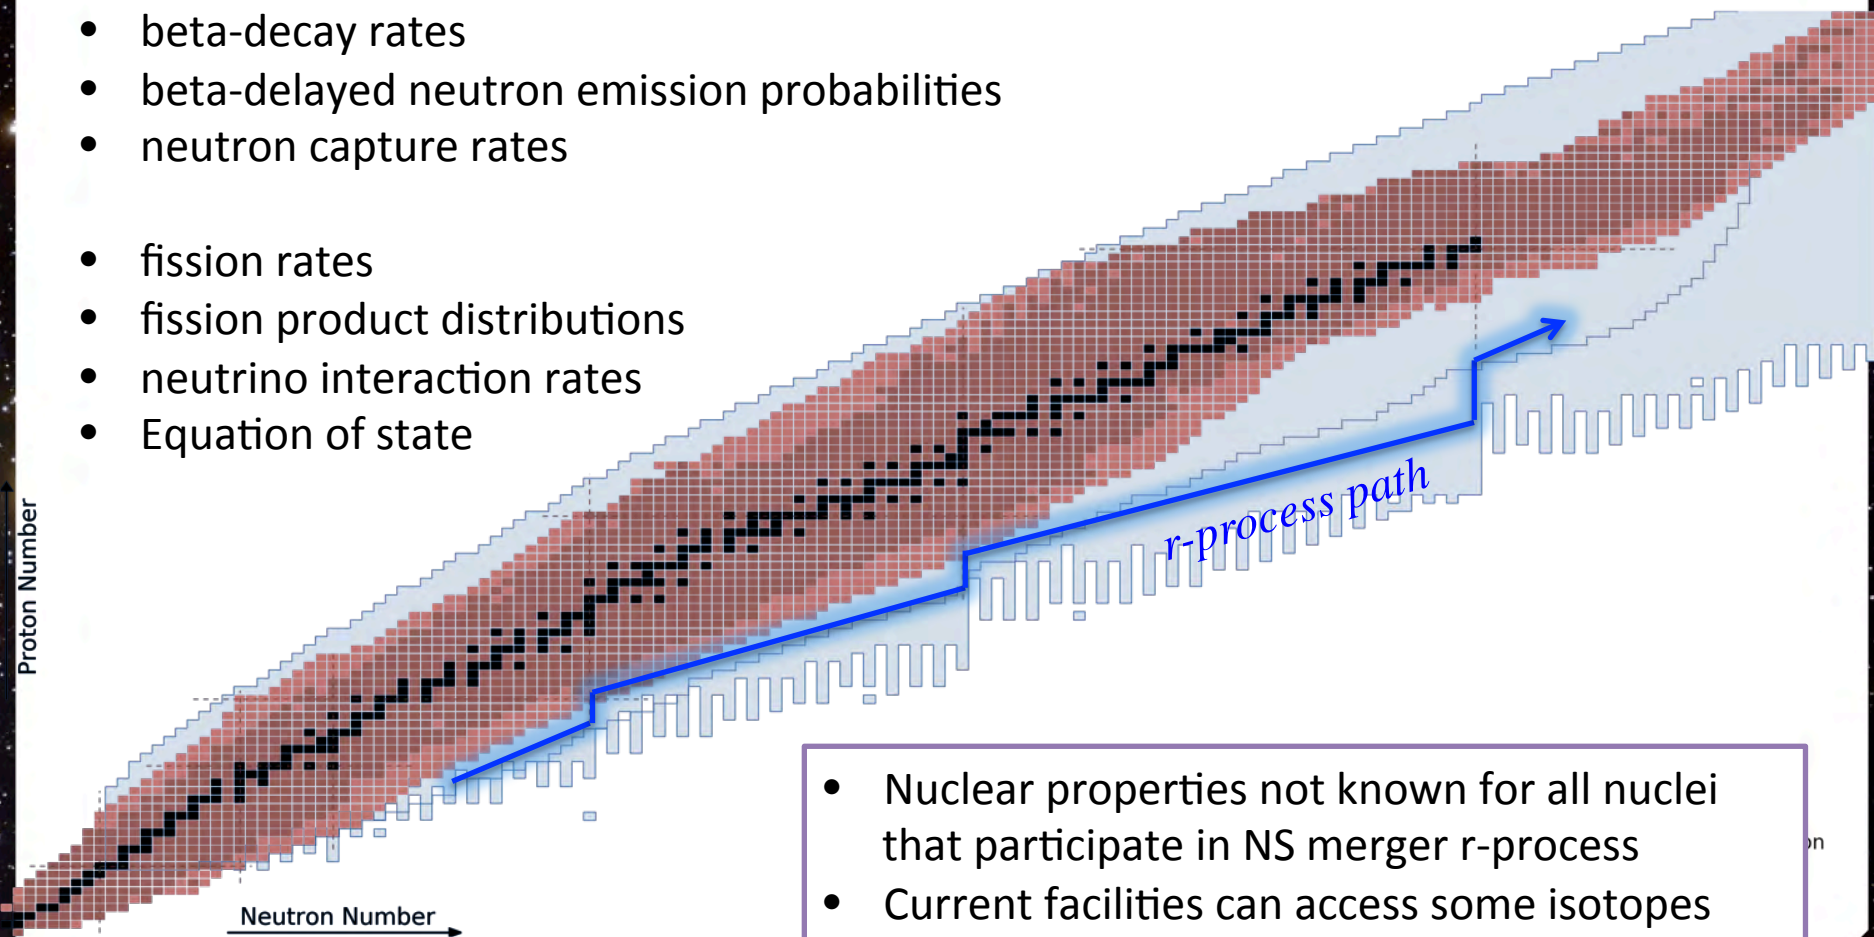

- What is needed?

Temperature =  $3.20E+05$  K  
 Density =  $1.70E-24$  g /  $cm^3$

# Nuclear Input for r-process

- masses
- beta-decay rates
- beta-delayed neutron emission probabilities
- neutron capture rates
  
- fission rates
- fission product distributions
- neutrino interaction rates
- Equation of state

- Nuclear properties not known for all nuclei that participate in NS merger r-process
- Current facilities can access some isotopes
- Next generation facilities will give access to the majority of r-process nuclei

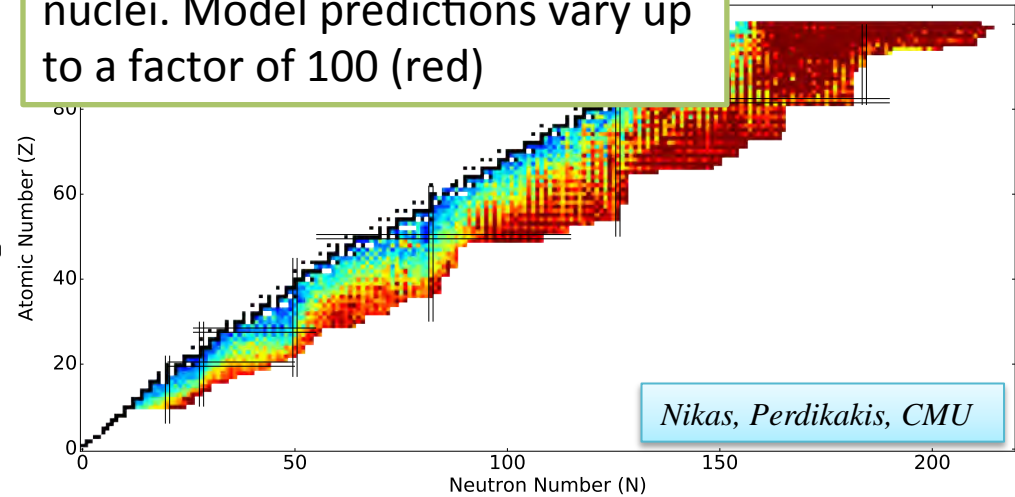

# How well can we predict nuclear properties?

**Mass models diverge** when no data is available

**Neutron-captures** are completely unconstrained for r-process nuclei. Model predictions vary up to a factor of 100 (red)

*Nikas, Perdikakis, CMU*

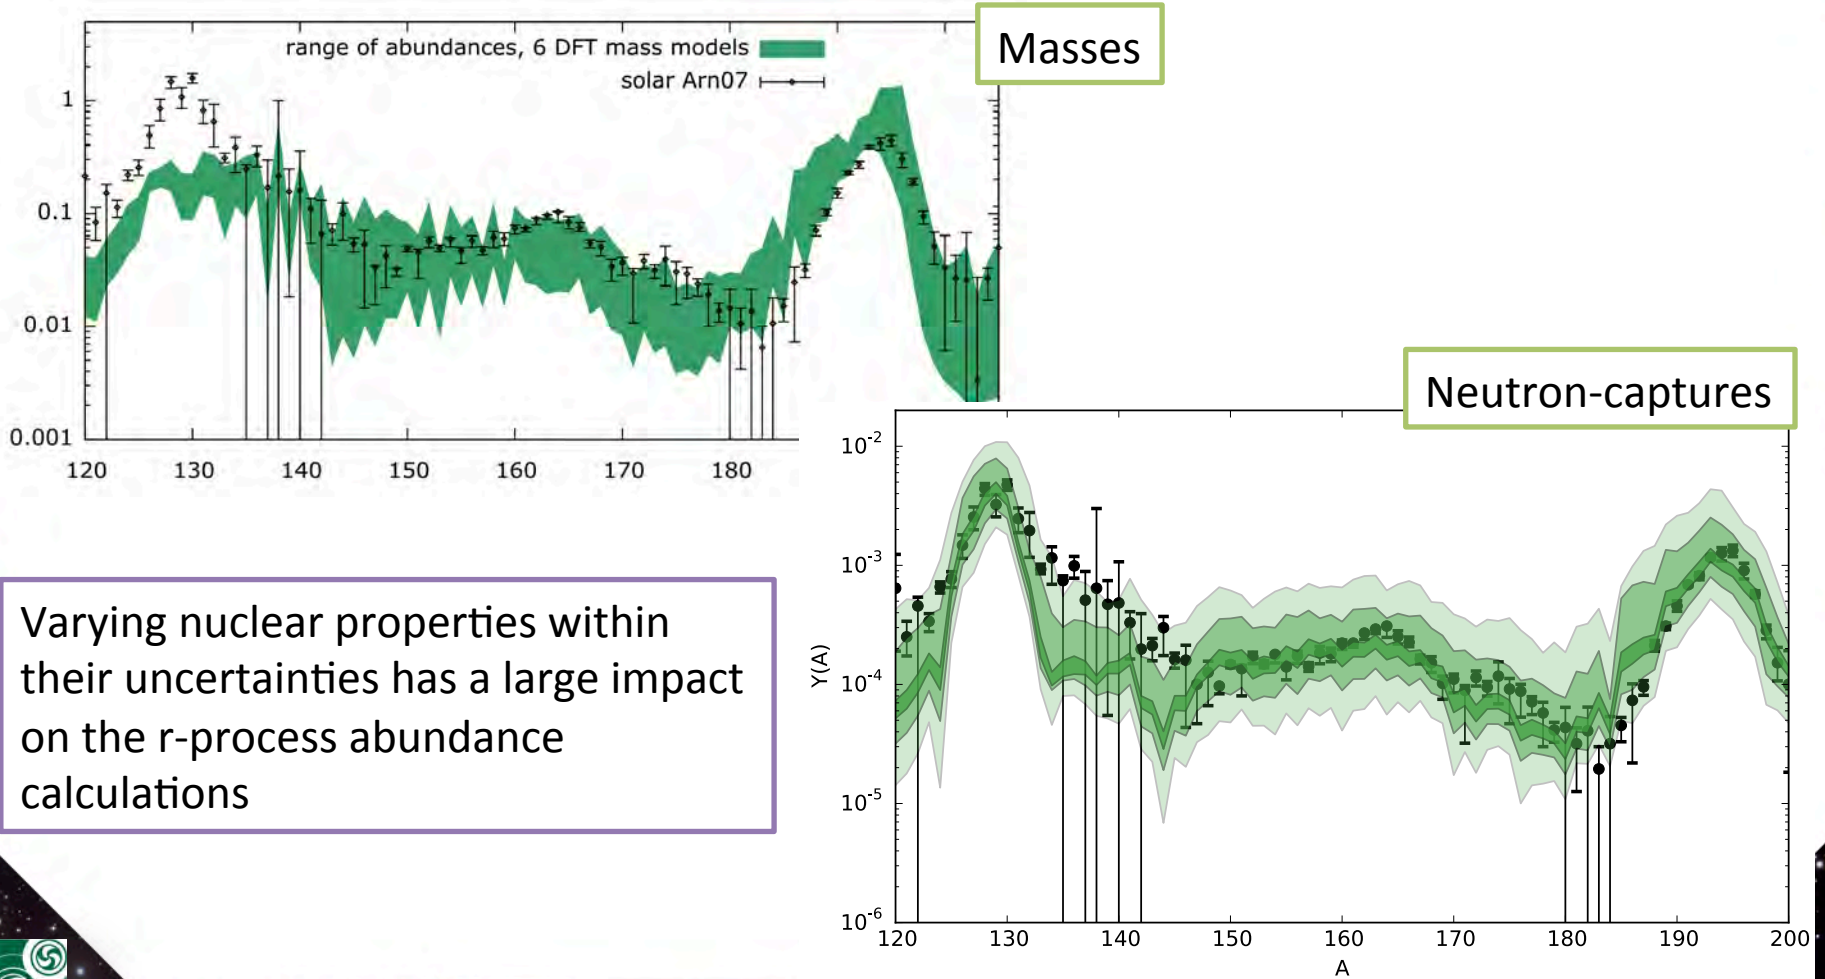

**Half-life** calculations can be more than a factor of 10 different than experiment

# Impact of nuclear uncertainties

With GW170817 discovery, nuclear physicists can focus on NS merger scenario instead of running a range of speculative sites.

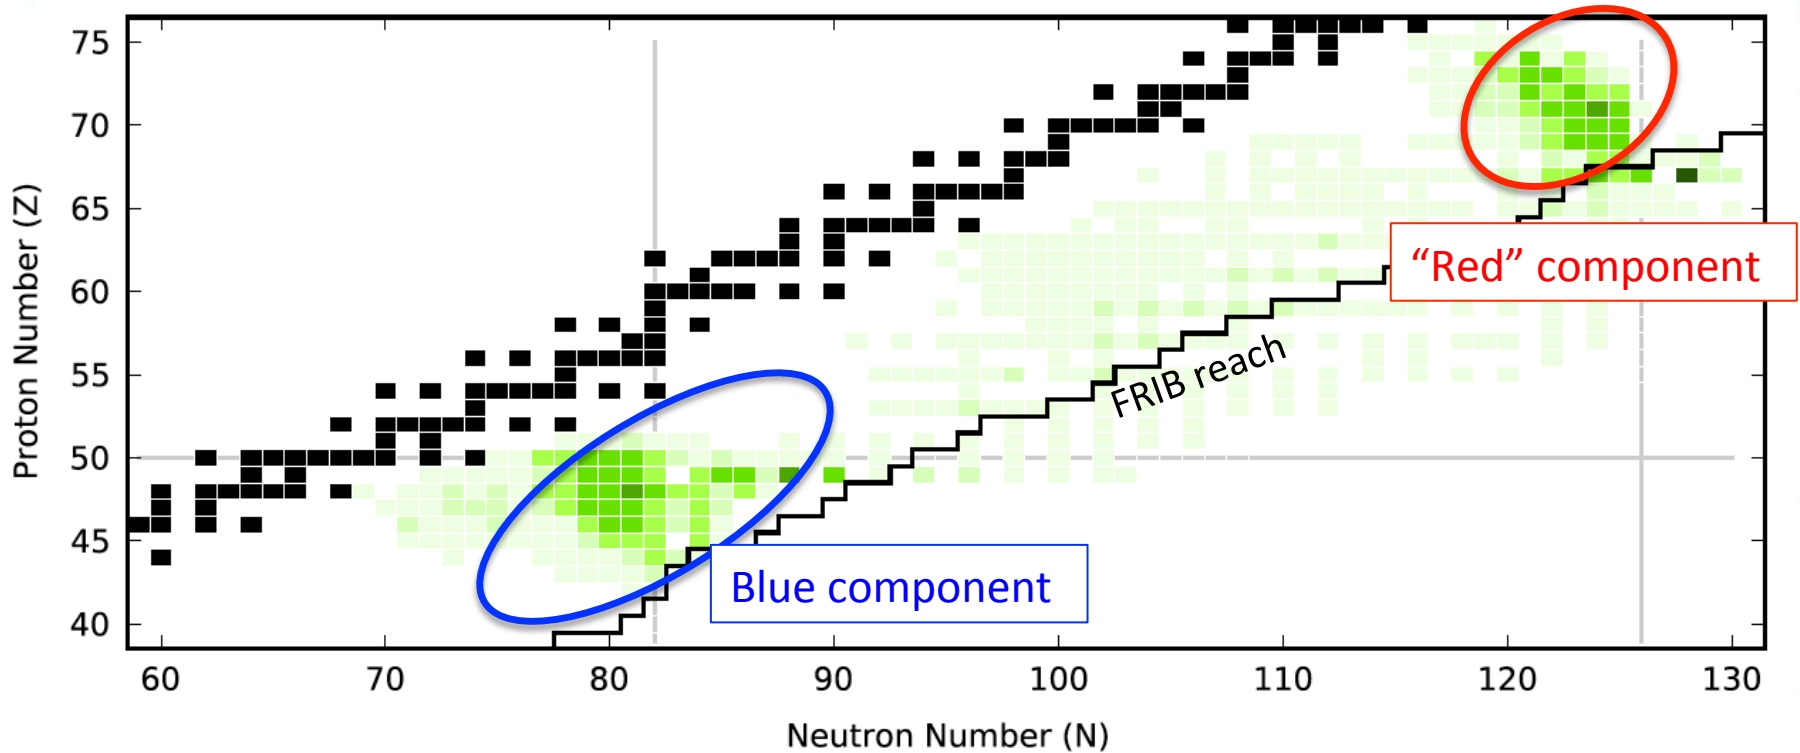

Varying nuclear properties within their uncertainties has a large impact on the r-process abundance calculations

# Which nuclei are the most important?

Important nuclei for both components identified and within reach of FRIB

# Experiments – current efforts

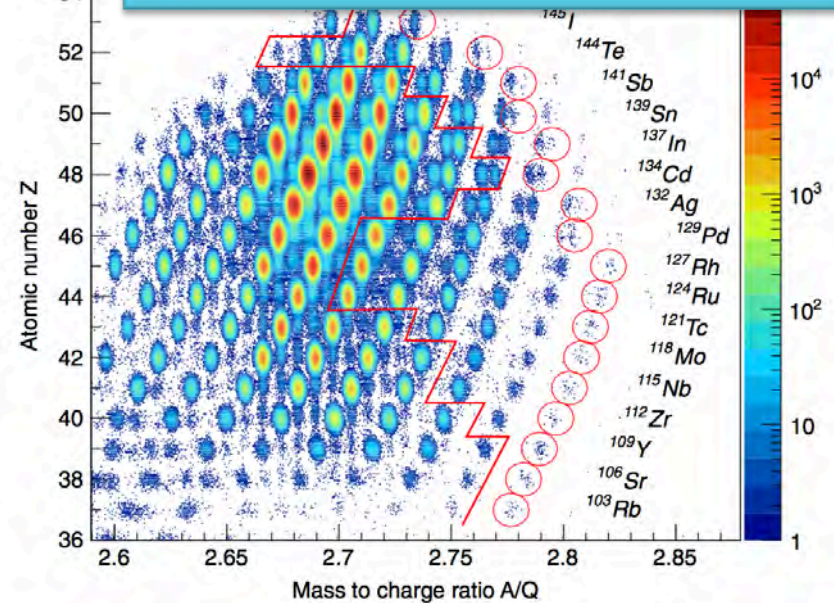

Radioactive beam facilities around the world are measuring important nuclear properties for the r-process

*J. A. Clark and G. Savard, Int. J. Mass Spectrom. 349-350, 81 (2013).*

Mass measurements at Argonne National Lab

*G. Lorusso, et. al. Phys. Rev. Lett. 114 (2015) 192501*

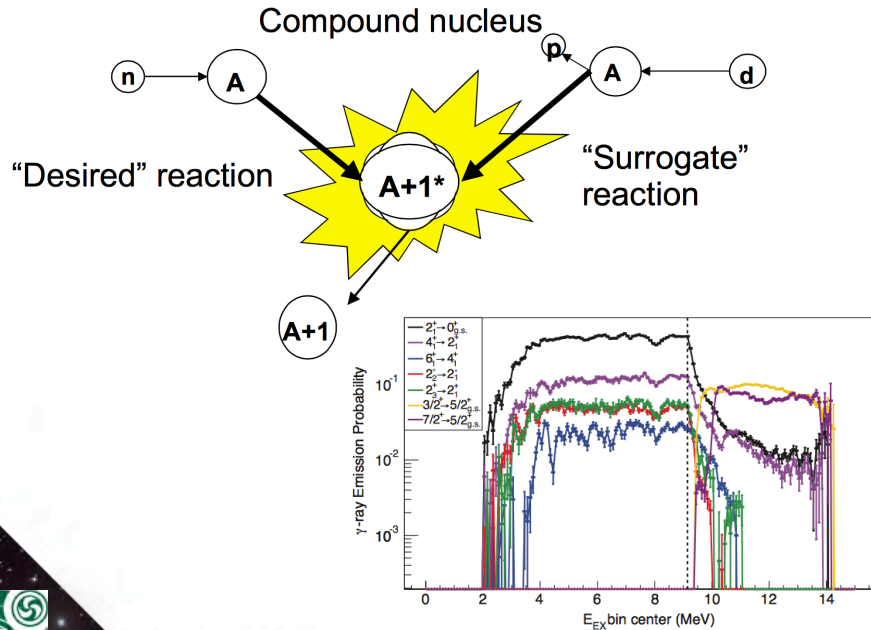

Half-life measurements at RIKEN, Japan

- Masses and half-lives can be measured directly, provided the radioactive beam of interest is available
- Neutron captures extremely challenging to measure on radioactive nuclei

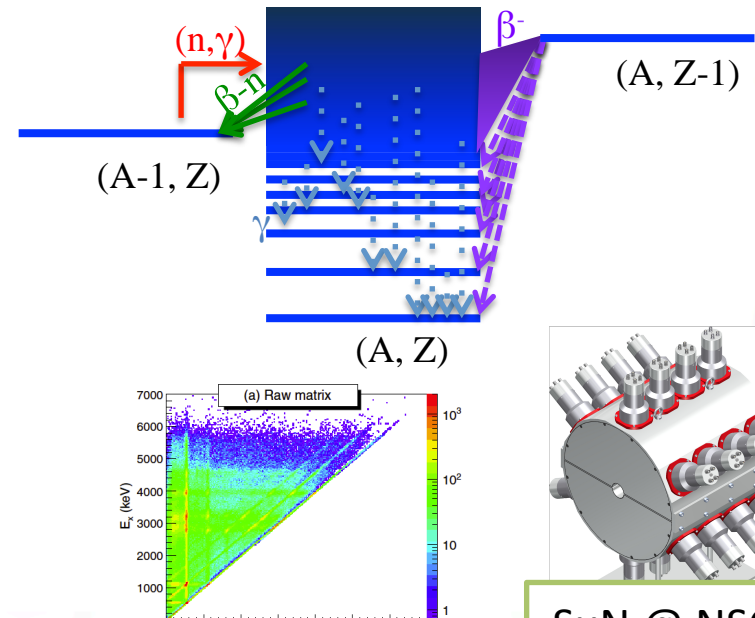

# Neutron Captures

- Direct measurement of  $(n,\gamma)$  reactions on short-lived isotopes: challenging
- Indirect techniques developed
- $(d,p)$  reactions as surrogate for  $(n,\gamma)$
- Measuring nuclear structure properties like nuclear level densities and  $\gamma$  strength to constrain  $(n,\gamma)$  far from stability ( $\beta$ -Oslo)
- Ready to be applied with FRIB beams

A. Ratkiewicz, J. Cizewski, et. al. EPJ WoConf. 2015

Spyrou, Liddick, et. al., PRL 2014

SuN @ NSCL

# FRIB Project Summary

*DOE Office of Science supports establishment of FRIB*

- FRIB will be a \$730 million national user facility funded by the Department of Energy Office of Science (DOE-SC), Michigan State University, and the State of Michigan
- FRIB Project completion date is June 2022, managing to an early completion in fiscal year 2021
- FRIB will serve as a national user facility for world-class rare isotope research, (~1400 scientists currently engaged) and builds on more than 50 years of nuclear science expertise developed at MSU

# How does FRIB work

For now, use  
NSCL Coupled Cyclotrons

Gas Stopping

Reacceleration  
to low astrophysical energies

Fast Beams

Fragmentation

# Available Equipment for r-process experiments

For now, use  
NSCL Coupled Cyclotrons

LEBIT: Masses

VANDLE:  $\beta n$  values

S800: masses, (d,p)

GRETINA: (d,p) for (n, $\gamma$ )

NERO:  $\beta n$  values

SuN:  $\beta$  decay, (n, $\gamma$ )

# Conclusions

**For questions:**  
#GWnuclear  
gwnuclear@nscl.msu.edu

- GW170717 discovery creates opportunities for nuclear science
- Better understanding of the individual element contributions in NS mergers requires accurate nuclear input
- R-process measurements already at current facilities
- Important nuclei identified and within reach of FRIB
- Existing equipment and techniques ready for FRIB day-1 experiments
- New equipment under development to take full advantage of FRIB capabilities
